### ALIGNMENTS

Syncrostic antiviral composition contains BFGF and sulphated by polyaccharide for treating viral infections e.g. HSV-1 and -2, cytomegalovirus, HIV, influenza virus etc.

Pisclosure; Page 4; 20pp; English.

This sequence represents acidic fibroblast growth factor (aFGF).

This sequence in the acidic fibroblast growth factor (aFGF).

This sequence is found to have a greater antiviral activity than sequence 140 AA; 26-JAN-1993 (first entry)
Human acidic fibroblast growth factor.

29-DEC-1996 (first entry)
Human acidic fibroblast growth factor.
Endothelial cell growth factor; ECGF; blood vessel; regeneration; heparin-Sepharose affinity chromatography; probe; oligonucleotide; FGF; fibroblast growth factor: ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New recombinant human acidic fibroblast growth factor - used to promote cell growth, to promote wound healing, for vascular grafts and blood vessel repair.

Claim 2: Column 30: 25pp; English.
Oligonucleotides were synthesized on the basis of the amino acid sequence of boxina acidic fibroblast growth factor (aFFF) and used to produce a synthetic gene (given in Q88233) incorporating codons preferred by E. coli or mammalian cells, unique cloning sites, etc. This synthetic gene was mutagenized to obtain a gene encoding a human recombinant aFGF (R74647) having activity Sequence 140 AA;
                                                                                                                                                                                                                                                                                                                                                                                                      25-SEP-1995 (first entry)
Human recombinant aFGF.
Acidic fibroblast growth factor; aFGF; vulnerary; anglogenesis;

FOF mutein prepn. useful for therapy of burn or thrombosis - by rransformation of lymphocyte-contained animal cell by vector contg. DNA encoding FGF mutein Disclosure; Page 3; 23pp; Japanese.
The invention covers muteins of FGF (esp. bFGF) which contain at least one glycosylation site. The muteins can be used to treat burns and thrombosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           6 GNYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDQHIQLQLSAESVGEVYIKSTETGOYL 65

                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                      Groated, purified, biologically active bovine beta endothelial cell growth factor - useful to regenerate or treat damaged blood vessels bisclosure; Fig 8: Bapp: English.

Bovine beta-endothelial cell growth factor (beta-ECGF; W0399) having a mol.wt. of 20 kD can be purified at least 16300 fold from bovine brain using heparin-Sepharose affinity chromatography. ECGF is useful for, among other purposes, diagnostic applications and has potential in the treatment of damaged blood vessels or other endothelial cell-lined structures.

Human ECGF (737503) or fragments may be obtained using oligonucleotides (737504 and 737508 to 737509) whose design is based on the sequence of bovine alpha- and beta-ECGF.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mitogenic polypeptide isolated from human brain tissue - useful for increasing vascular effect in eg wound healing, or generating endothelial cell linings for vascular prostheses, etc. claim 3; Page 1; 31pp; English.
The PF of the invention was obtd. from human brain tissue. It has a mol. wt. of 15,200-16,500 (pref. 15,616-16,056) and has a high affinity for heparin. PFl and fragments are useful for promoting the growth of mesoderm-derived cells or neuroectoderm-derived cells and generating endothelial cell linings for vascular prostheses (all claimed). The polypeptides are useful for increasing vascularisation.
                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   peptides derived from the protein, esp. from A-D can be used to as antigens to produce anti-aFGF antibodies. The peptides must comprise 8-10 continuous AAs from A or B (claims 5 and 6 resp.), 7-10 continuous AAs from C (claim 7), or 8-9 continuous AAs from D (claim 8). The Abs can be used for immunochemically measuring aFGF, and for purifying aFGF. They are useful as reagents in the diagnosis of various cancers or diseases of the CNS. Purified aFGF Sequence 141 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                7 GNYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDQHIQLQLSAESVGEVYIKSTETGQYL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 2: Fig 3a: 120 microporates useful restriction sites at frequent intervals to facilitate the cassette mutagenesis of selected regions. Also included are flanking sites to simplify the incorporation of the gene into any expression system. The arch more accordent of the gene into any expression system. The arch mol. acts in a cascade effect to control endothelial cell activity either co-ordinately through synergistic effects or via independent routes. The regulation of endothelial cells is essential for the protection of arteries, velus and capillaries from the effect of thrombogenesis. Their stimulation and control by these factors is also thought to be important in the development of tumours and

DNA encoding a cleavable signal peptide and an endothelial cell growth factor - useful for producing recombinant endothelial cell growth factor proteins claim 1; Column 16; 23pp; English.

This represents the amino acid sequence of human beta-endothelial cell growth factor (ECGF). The invention is directed to DNA encoding alpha-or beta-ECGF and plasmids comprising the DNA sequences. The DNA encodes a cleavable signal peptide and an ECGF, where removal of the signal peptide yields a mature form of the ECGF. The DNA is used to produce recombinant ECGF proteins, which can be used in treatments to repair or regenerate blood vessels or other structures lined with endothelial cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated, purified, biologically active bovine beta endothelial cell growth factor - useful to regenerate or treat damaged blood vessels bisclosure; Fig 8: 28pp; English and the beta endothelial cell growth factor (beta-ECGF; W0399) having a mol.wt. of 20 kD can be purified at least 16300 fold from bovine brain using heparin. Sepharose affinity chromatography. ECGF is useful for, among other purposes, diagnostic applications and has potential in the treatment of damaged blood vessels or other endothelial cell-lined structures. Human ECGF (137503) or fragments may be obtained using oligonucleotides (137504 to and 137508 to 137509) whose design is based on the sequence of bovine alpha- and beta-ECGF.

cell growth factor polypeptides
Claim 1; Column 16; 23pp; English.
This sequence represents the amino acid sequence of the mature human
beta-endothelial cell growth factor (b-ECGF). This amino acid sequence
is identical to the alpha-ECGF but the beta sequence contains an extra
20 N terminal amino acids. The sequence was isolated from a human brain
stem cell cDNA library using a probe designed based on fragments of the
bovine ECGF (see W75416-W75418). The ECGF protein can be used in
compositions for promoting wound healing. ECGF is also used to grow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    20 GNYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDQHIQLQLSAESVGEVYIKSTETGQYL 79

Claim 1: Column 16: 22pp; English.

Human recombinant endothelial cell growth factors (ECGF) beta

Human recombinant endothelial cell growth factors (ECGF) beta

They can be produced in transformed prokaryotic or eukaryotic host

cells using DNA sequences (T45983 and T45984, respectively) derived

from the complete human ECGF CDNA (T45985). Large quantities of

the ECGFs are produced by culturing the host cells and recovering

the proteins. ECGFs have utility in the growth and amplification

of endothelial cells in culture. They can potentially be used to

treat damaged blood vessels and other endothelial cell-lined

Novel fusion proteins comprise FGF linked to saporin. FGF-1 to -9
may be used, pref. FGF-1 (R70812), FGF-5 (R70813), FGF-7 (R70814) or
FGF-8 (R70815) muteins, in which at least 1 Cys residue is replaced
by conservative Ser substitutions. The fusion proteins are potent
cytocidal agents to cells bearing the FGF receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          21 GNYKKPKLLYCSNGGHFLRILPDGTVDGTRDRSDQHIQLQLSAESVGEVYIKSTETGQYL 80

Human endothelial cell growth factor - produced by recombinant DNA techniques, useful for wound healing Example; Ftq 8: 43pp; English.

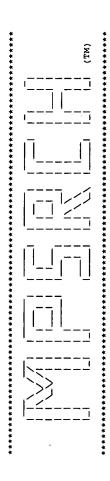

Example; Ftq 8: 43pp; English.

To screen the human brain stem CDNA library for clones contg. ECGF inserts, a specific obligonucleotide was designed. This obligonucleotide was based upon a partial AA sequence analysis of the amino terminus of ECGF (see P704480 and P70481). Ftg 3c sets forth for comparison the AA sequence of cyanogen bromide-cleaved bovine alpha and beta ECGF (P70834). The two clones that were isolated, ECGF clones 1 and 29, were analysed in further detail. The nucleotide sequence of these clones and the AA sequence deduced from the nucleot acid sequence is shown in Fig 8 (see N70788 and P70482).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Length 155;

            endothelial cell growth factors. Both are angiogenic agents in vivo and are potent mitogens for a variety of mesoderm-derived cell types in vitro (although bFGF is 30-100 times more potent than aFGF in stimulating the proliferation of normal diploid cells). There are differences in the tissue distribution and concentration of these two growth factors.

This protein binds heparin, although less strongly than does bFGF. There are some sequence similarities between residues 117-126 (a region flanked by Lys-Lys dipeptides) and a number of neuropeptides, including a gastrin-releasing peptide from the pig
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        #authors Risau, W.; Gautschi-Sova, P.; Boehlen, P.

J. Biol. Chem. (1992) 267:4870-4877
Molecular cloning and expression of two distinct
CDNA-encoding heparan sulfate proteoglycan core proteins
from a rat endothelial cell line.

NT The acidic and basic fibroblast growth factors are the major
endothelial-cell growth factors. Both are angiogenic agents in
vivo and are potent mitogens for a variety of mesoderm-derived
cell types in vitro (although bFGF is 30-100 times more potent
than aFGF in stimulating the proliferation of normal diploid
                                                                                                                                                                                                                                                                                                                                                                                                                                                 This protein binds heparin more strongly than does aFGF.

#Superfamily fibroblast growth factor
alternative splicing; angiogenesis; growth factor; heparin
binding; mitogen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          86 AMKEDGRLLASKCVTDECFFFERLESNNYNTYRSRKYS--SWYVALKRTGQYKLGPKTGP 143

SUBDITIED (APR-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: CELL SURFACE PROTEOGLYCAN THAT BEAR HEPARAN SULFATE.
-!- SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.
-!- TISSUE SPECIFICITY: EXPRESSED IN EPITHELIAL AND FIBROBLASTIC

SEQUENCE FROM N.A.

Bridgeman A.;

SIMILARITY: BELONGS TO THE SYNDECAN FAMILY OF INTEGRAL MEMBRANE PROTEOGLYCANS.

-!- FUNCTION: THE HEPARIN BINDING GROWTH FACTORS ARE ANGIOGENIC AGENTS
IN VIVO AND ARE POTENT MITOGENS FOR A VARIETY OF CELL TYPES IN
VITRO. THERE ARE DIFFERENCES IN THE TISSUE DISTRIBUTION AND
CONCENTRATION OF THESE 2 GROWTH FACTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TISSUE-RETINA;

-!- FUNCTION: THE HEPARIN-BINDING GROWTH FACTORS ARE ANGIGGENIC AGENTS
IN VIVO AND ARE POTENT MITOGENS FOR A VARIETY OF CELL TYPES IN
VITRO. THERE ARE DIFFERENCES IN THE TISSUE DISTRIBUTION AND
CONCENTRATION OF THESE 2 GROWTH FACTORS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SUBUNIT: MONOMER.
